

DATENANALYSE

So heiss, trocken, tödlich war der Sommer

The Swiss summer of 2026 broke all records.

Data reveals the stark reality of climate change arriving at our doorstep, bringing catastrophic fallout.

Shattering Averages

Average (1990-2020)

Summer 2003

Summer 2022

Summer 2026

The national average temperature between June and August was 23.8°C, eclipsing the legendary heatwave of 2003.

The Economic Toll

1.6B

SWISS FRANCS

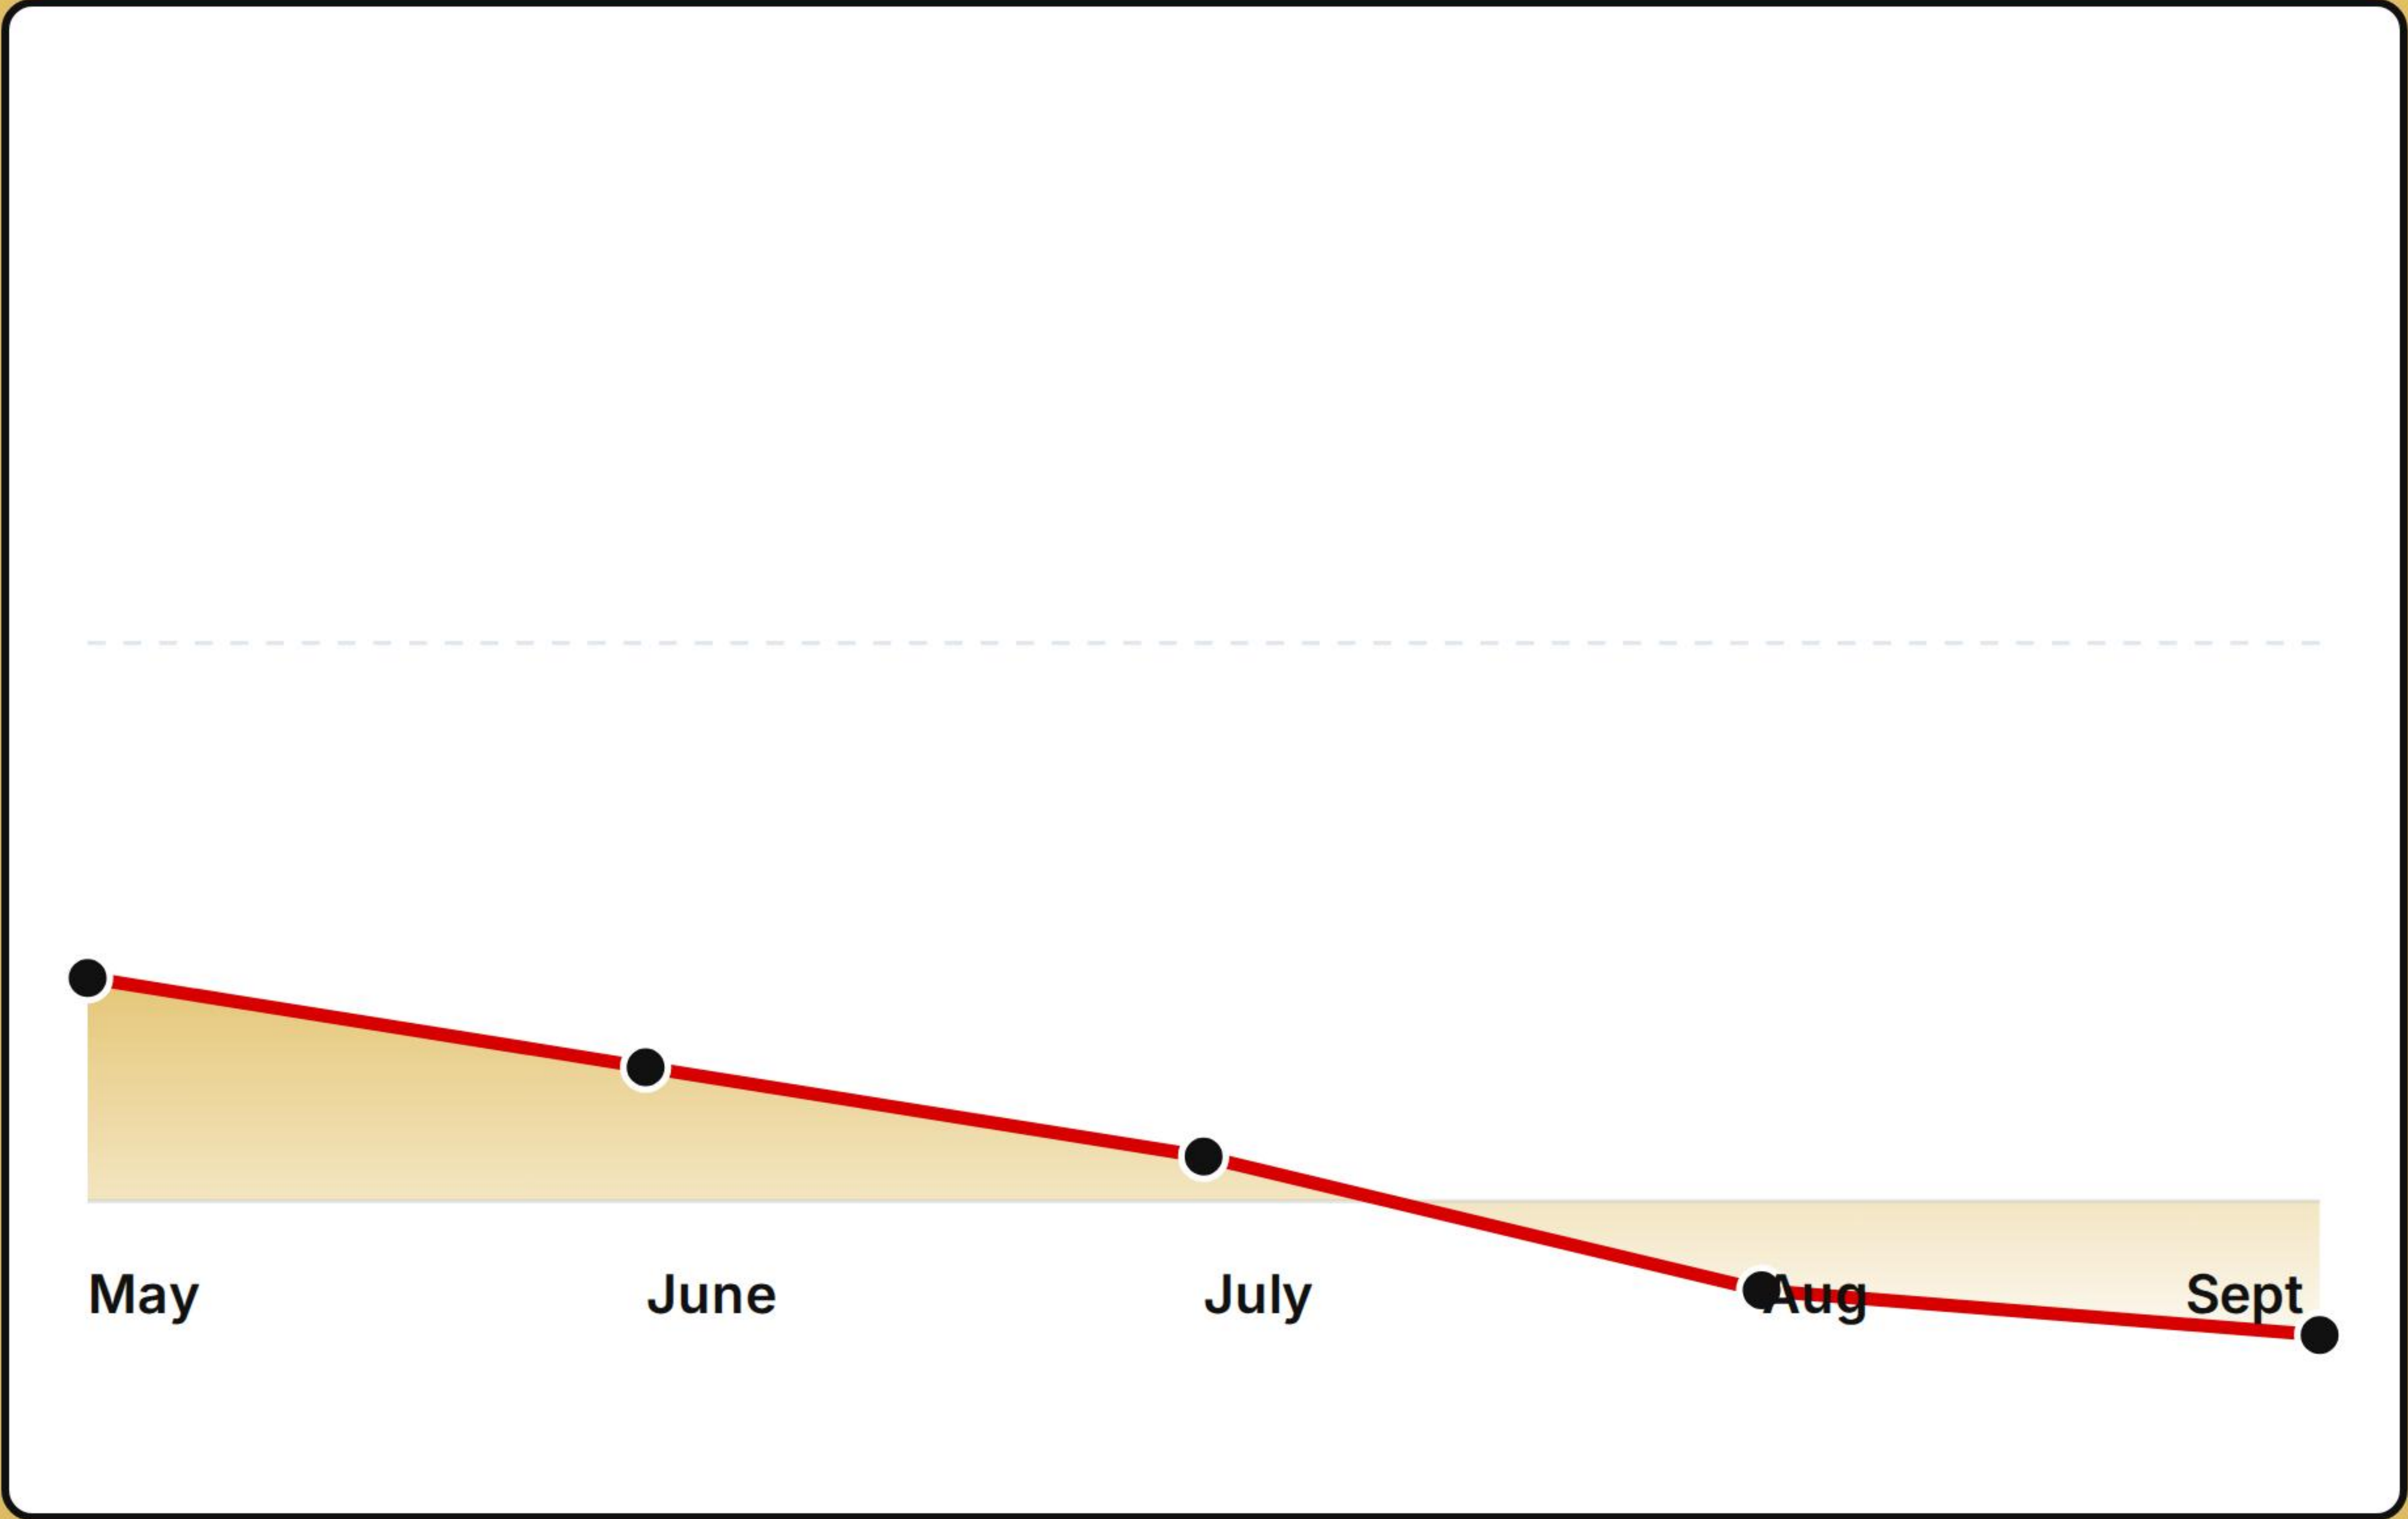

The estimated financial damage across the agricultural, infrastructure, and healthcare sectors.

Prolonged drought led to widespread crop failures, while melting permafrost caused severe infrastructure damage.

A Historic Drought

Cumulative rainfall (mm) from May to August starved major rivers.

Beyond the Thermometer

Agriculture Collapse: Wheat and corn yields in the plateau dropped by 35%.

Energy Crisis: Hydropower production plummeted as river levels hit century lows.

Health Emergency: Excess mortality rates among the elderly spiked by 12% in July.

The New Normal

"What we experienced this summer is not an anomaly. By 2040, a summer like 2026 will be considered average."

The data doesn't lie.
